CLAIMS

- 1. A method for efficiently searching a hash table containing a plurality of ranges,
- the method comprising:
- performing one or more preliminary range checks on at least one target value,
- each preliminary range check generating an output value having a value dependent on
- 5 whether the target value is included in a predefined range of values associated with the
- 6 preliminary range check;
- 7 combining signature information with the output values generated by the prelimi-
- 8 nary range checks to generate a modified signature;
- applying a predetermined function to the modified signature to derive an index
- that references a hash-table entry in the hash table;
- locating a searchable data structure associated with the hash-table entry refer-
- enced by the index, the searchable data structure comprising one or more search nodes, at
- least one of the search nodes configured to store one or more target-value ranges associ-
- ated with the target value; and
- searching the search nodes in the searchable data structure until a matching search
- node is found whose stored target-value ranges associated with the target value include
- 17 the target value.
- 1 2. The method of claim 1, wherein the searchable data structure is a linked list and
- the search nodes in the searchable data structure are linked-list entries.
- 1 3. The method of claim 1, wherein the output values generated by the preliminary
- 2 range checks are concatenated with the signature information to generate the modified
- 3 signature.
- 1 4. The method of claim 1, wherein the step of searching the search nodes in the
- 2 searchable data structure further comprises:

3	searching the search nodes until a matching search node is found that not only
4	stores target-value ranges including their associated target values, but also stores the sig-
5	nature information.
1	5. The method of claim 4, wherein the signature information and the target value are
2	obtained from predetermined fields in a packet's network headers or from other packet-
3	related information.
1	6. The method of claim 5, further comprising:
2	extracting data-flow information from the matching search node, the data-flow
3	information being used to route the packet.
	The week of a Calaina 1 and ancie the stan of applicing a modetamained function to
1	7. The method of claim 1, wherein the step of applying a predetermined function to
2	the modified signature generates one or more output bits, and a predetermined set of the
3	output bits are masked to derive the index.
l	8. An intermediate network node configured to perform flow-based processing, the
2	intermediate network node comprising:
3	a network interface for receiving a data packet;
4	a memory adapted to store a hash table organized as a plurality of indexed hash-
5	table entries, each hash-table entry associated with a corresponding linked list and each
6	linked list containing one or more linked-list entries; and
7	a system controller configured to efficiently search the hash table, the system
8	controller:
9	obtaining signature information and at least one target value from a
10	set of predetermined fields in the received packet's network headers;
11	performing one or more preliminary range checks on at least one
12	of the target values, each preliminary range check generating an output
13	value having a value dependent on whether the target value is included in

14

a predefined range of values associated with the preliminary range check;

combining the signature information with the output values gener-15 ated by the preliminary range checks to generate a modified signature; 16 applying a predetermined function to the modified signature to de-17 rive an index that references a hash-table entry in the hash table; 18 locating a linked list associated with the hash-table entry refer-19 enced by the index, the linked list comprising one or more linked-list en-20 tries, each entry configured to store at least one target-value range associ-21 ated with the target value; and 22 searching linked-list entries in the linked list until a matching 23 linked-list entry is found whose stored target-value ranges associated with 24 the target value include the target value. 25

- 9. The intermediate network node of claim 8, further comprising a processor,
- wherein the memory is further adapted to store instructions for execution by the
- processor, at least a portion of the instructions defining a router operating system con-
- figured to route the received packet based on a data flow associated with the received
- 5 packet.

1

- 1 10. The intermediate network node of claim 9, wherein the system controller identi-
- 2 fies data-flow information stored in the matching linked-list entry and transfers the data-
- flow information to the router operating system which routes the received packet in ac-
- 4 cordance with the data-flow information.
- 1 11. The intermediate network node of claim 8, wherein the system controller searches
- the linked-list entries until a matching linked-list entry is found that not only stores tar-
- 3 get-value ranges including their associated target values, but also stores the signature in-
- 4 formation.
 - 12. The intermediate network node of claim 11, further comprising a processor,

- wherein the memory is further adapted to store instructions for execution by the processor, at least a portion of the instructions defining a router operating system configured to route the received packet based on a data flow associated with the received
- 1 13. The intermediate network node of claim 12, wherein the system controller identi-
- fies data-flow information stored in the matching linked-list entry and transfers the data-
- flow information to the router operating system which routes the received packet in ac-
- 4 cordance with the data-flow information.

packet.

- 1 14. An apparatus for efficiently searching a hash table containing a plurality of ranges, the method comprising:
- means for performing one or more preliminary range checks on at least one target value, each preliminary range check generating an output value having a value dependent on whether the target value is included in a predefined range of values associated with the preliminary range check;
 - means for combining signature information with the output values generated by the preliminary range checks to generate a modified signature;
 - means for applying a predetermined function to the modified signature to derive an index that references a hash-table entry in the hash table;
 - means for locating a searchable data structure associated with the hash-table entry referenced by the index, the searchable data structure comprising one or more search nodes, at least one of the search nodes configured to store one or more target-value ranges associated with the target value; and
- means for searching the search nodes in the searchable data structure until a matching search node is found whose stored target-value ranges associated with the target value include the target value.
- 1 15. The apparatus of claim 14, wherein the searchable data structure is a linked list and the search nodes in the searchable data structure are linked-list entries.

- 1 16. The apparatus of claim 14, wherein the output values generated by the prelimi-
- 2 nary range checks are concatenated with the signature information to generate the modi-
- 3 fied signature.
- 1 17. The apparatus of claim 14, further comprising:
- means for searching the search nodes in the searchable data structure until a
- matching search node is found that stores target-value ranges including their associated
- 4 target values and also stores the signature information.
- 1 18. The apparatus of claim 17, wherein the signature information and the target val-
- 2 ues are obtained from predetermined fields in a packet's network headers or from other
- 3 packet-related information.
- 1 19. The apparatus of claim 18, further comprising:
- means for extracting data-flow information from the matching search node, the
- data-flow information being used to route the packet.
- 1 20. The apparatus of claim 14, wherein the means for applying a predetermined func-
- tion to the modified signature generates one or more output bits and a predetermined set
- of the output bits are masked to derive the index.
- 1 21. A computer-readable media including instructions for execution by a processor,
- the instructions for a method of efficiently searching a hash table comprising a plurality
- of ranges, the method comprising:
- 4 performing one or more preliminary range checks on at least one target value,
- each preliminary range check generating an output value having a value dependent on
- 6 whether the target value is included in a predefined range of values associated with the
- 7 preliminary range check;
- s combining signature information with the output values generated by the prelimi-
- 9 nary range checks to generate a modified signature;

applying a predetermined function to the modified signature to derive an index 10 that references a hash-table entry in the hash table; 11 locating a searchable data structure associated with the hash-table entry refer-12 enced by the index, the searchable data structure comprising one or more search nodes, at 13 least one of the search nodes configured to store one or more target-value ranges associ-14 ated with the target value; and 15 searching the search nodes in the searchable data structure until a matching search 16 node is found whose stored target-value ranges associated with the target value include 17 the target value. 18
